

Pin Hexagon Button Head Self Tapping Screws

We can supply a wide range of pin hex button head self-tapping screws, with a selection of diameters and lengths.

Pin hex button head self-tapping screws are a form of security screw, dramatically reducing the risk of vandalism, theft, and possibly injury. Typical areas of application tend to be in areas accessible by the public, such as transport, street furniture, hotels, places of education, hospitals, and prisons. They are used in alarm systems, and fencing, as well as signage. The screw cuts its own thread into a pre-drilled surface (sheet metal or plastic, for example) and gives grip, therefore not requiring to be tightened from the other end. Ideal where only one side can be accessed.

AVAILABLE IN:

A2 Stainless
Steel
